North Kivu is currently embroiled in some of the heaviest fighting since the end of the war in 2003. Developments since the beginning of 2008 imply that this should not be the case. A peace agreement was signed in January between the government, various rebel forces and most importantly, General Nkunda’s Congrès National pour la defense du peuple (CNDP). The CNDP represents a major faction whose battles with government forces have repeatedly violated the ceasefire.

By August 2008, renewed fighting flared up between the army and CNDP in North Kivu. Tensions have been intensified by civilian attacks carried out by the Lord’s Resistance Army from Uganda. As of October 31, the CNDP has advanced with the intention of capturing Goma but has now proposed a ceasefire brokered by the United Nations Mission in the Democratic Republic of Congo (MONUC) to allow humanitarian access.

There is now massive displacement of those afraid of the next eruption of violence. More than a million persons are displaced in DRC, with two thirds in North Kivu. Since August, an additional 100,000 have been displaced in North Kivu, adding to the 500,000 already displaced between 2006 and 2008. In Kibati camp, north of Goma, UNHCR staff have accommodated some 30,000 new arrivals. Others have reportedly fled to Uganda, Sudan and Rwanda.

Military engagement in Goma has forced many aid agencies to evacuate. This is particularly worrying given the massive scale of displacement, reports of violence against civilians and the usual dire lack of access to basic infrastructure.

CE-DAT is a global database on the human impact of conflicts and other complex humanitarian emergencies and serves as a unique source of health indicators for monitoring conflict-affected populations and for the production of trend analyses, impact briefings and policy recommendations.

Massive displacement has already begun. Residents from the North Kivu province are fleeing the violence and adding to the existing 1.25 million internally displaced people (IDP) in DRC and over 100,000 Congolese refugees in neighbouring countries. These types of population movements can result in the emergence of large-scale epidemics, as was the case in 1994 in Goma, where a cholera epidemic killed 12,000 Rwandese refugees. In addition to the displaced Congolese, some 50,000 Rwandan and Burundese refugees are currently living in eastern DRC. The current events will most likely have impacts on their health situation.

**Epidemics**

WHO has already reported hundreds of cases of cholera and several cases of measles. The principal causes for these are displacement and lack of clean water. Displaced people tend to gather in makeshift camps with poor hygiene conditions, increasing the risk for disease transmission. In addition, malnutrition, which can be related to acute displacement, impairs people’s resistance against diseases. In this context, a July 2008 measles epidemic in Katanga, some 600 km from North Kivu, is noteworthy. Although a massive vaccination campaign was undertaken, the situation should be closely monitored.

**Nutrition**

Over the last years, the nutritional status of children in North Kivu has generally remained relatively acceptable. An exception, however, is the area around Rutshuru, where surveys between 2001 and 2007 indicated levels above the emergency threshold.

**South Kivu**

Throughout the last 5 years, the health situation in South Kivu was poorer than in North Kivu. This difference however has almost disappeared and the health indicators for both provinces are at present almost at equal level. On the other hand, the north of South Kivu, bordering North Kivu, is the area where the situation is still the most precarious. The current violence and resulting influx of displaced people might compromise this positive evolution.

**Health Situation in North Kivu**

**Mortality**
For the last 10 years, the volatile eastern part of the Democratic Republic of Congo has been the scene of many clashes and hostilities. This unstable situation has had considerable impacts on the health condition of the local populations. Since 2000, the International Rescue Committee (IRC) has conducted several mortality surveys across DRC. In 2002, they reported that the mortality rate in the eastern part of the country was higher than in any other country in the world and much higher than the emergency threshold (1 death/10,000 people/day). The highest mortality rates in 2000-2001 were found in Mweso, a district close to Goma in North Kivu. More recent data however suggested an encouraging evolution. The latest IRC survey from 2007 showed a significant decrease in mortality rates in eastern DRC, below the emergency threshold in almost all surveyed areas. In addition, the highest figures were no longer in North Kivu.

**Nutrition**
Over the last years, the nutritional status of children in North Kivu has generally remained relatively acceptable. An exception, however, is the area around Rutshuru, where surveys between 2001 and 2007 indicated levels above the emergency threshold.

**South Kivu**
Throughout the last 5 years, the health situation in South Kivu was poorer than in North Kivu. This difference however has almost disappeared and the health indicators for both provinces are at present almost at equal level. On the other hand, the north of South Kivu, bordering North Kivu, is the area where the situation is still the most precarious. The current violence and resulting influx of displaced people might compromise this positive evolution.

**Acknowledgement**
We would like to thank the following organizations for their data: UNHCR, WHO, International Rescue Committee, Save the Children - UK, World Vision International, PRONANUT and Action contre la Faim International Network. We would also like to express our gratitude to the Bureau of Population, Refugees and Migration (US Department of State) and the Department for International Development of the UK government for supporting the CE-DAT project.

**Recommendations**
- Ensure adequate vaccination coverage, especially in areas with many displaced.
- Ensure access to clean water and food
- Prevent the conflict from affecting the health conditions of residents in South Kivu
